Table 2: Experimental results regarding the scalability of Algorithm **??**. Column $\#F_{total}$ indicates the total number of formulae in each dataset. The next column shows the number of formulae compiled only by D4 [?] but not by Algorithm **??**. Column #¬D4 shows the number of formulae not compiled by D4. The last column indicates the number of formulae that were only compiled by Algorithm **??**, but not by D4.

Table 4: Experimental results for Algorithm **??**. Column #F indicates with how many formulae the statistics have been computed. The 'Coverage' column indicates how often $|R_F|$ is within the confidence interval $[Y_l; Y_h]$ and thus measures the accuracy of our method.

Table 6: Experimental results comparing the bounds obtained with Algorithm **??** and with Lemma **??**. Column #F indicates with how many formulae the statistics have been computed. The 'Both' column indicates how often we have $Y_l \geq |R_{G_P}| \wedge Y_l \leq |R_F|$ and $Y_h \leq |R_{G_U}| \wedge Y_h \geq |R_F|$. The last two columns represent the observed median and maximum values of the ratio $r_c = \frac{min(Y_h, |R_{G_U}|) - max(Y_l, |R_{G_P}|)}{|R_{G_U}| - |R_{G_P}|}$, which was calculated exclusively if $Y_l \leq |R_F| \leq Y_h$. The number of formulae on which the last two columns are computed can easily be obtained by multiplying the #F column with the 'Coverage' column in Table 4.
