

Dataset	$\#F_{total}$	$\min(Var(F))$	$\max(Var(F))$	$\min(F)$	$\max(F)$
Global	4550	0	8286433	0	7689680
$\hookrightarrow$ Lagniez [?]	1948	5	229100	10	399794
$\hookrightarrow$ Soos [?]	1823	2	8286433	1	7689680
$\hookrightarrow$ Plazar [?]	501	14	486193	31	2598178
$\hookrightarrow$ Sundermann [?]	278	0	31012	0	350120

Table 1: Dataset summary. The first column indicates the dataset, and the $\#F_{total}$ column indicates how many satisfiable formulae the dataset contains. The following columns indicate the minimum and maximum number of variables (resp. clauses) in the dataset.

Dataset	$\#F_{total}$	$\#D4$	$\#\neg D4$	$\#CapKC \wedge \neg D4$	$\#DivKC \wedge \neg CapKC \wedge \neg D4$
Global	4550	185	670	80	55
$\hookrightarrow$ Lagniez [?]	1948	53	213	40	23
$\hookrightarrow$ Soos [?]	1823	100	393	40	28
$\hookrightarrow$ Plazar [?]	501	31	61	0	4
$\hookrightarrow$ Sundermann [?]	278	1	3	0	0

Table 2: Experimental results regarding the scalability of DivKC and CapKC. Column $\#F_{total}$ indicates the total number of formulae in each dataset. The next column shows the number of formulae compiled only by D4 [?] but not by DivKC or CapKC. Column $\#\neg D4$ shows the number of formulae not compiled by D4. Column $\#CK \wedge \neg D4$ shows the number of formulae that are compiled by CapKC but not by D4. The last column indicates the number of formulae that were only compiled by DivKC, but not by D4 or CapKC.

Dataset	$\#F_{total}$	$\#\neg D4$	$\#\neg D4 \wedge CapKC$	$\#\neg D4 \wedge DivKC$	$\#CapKC \wedge \neg DivKC \wedge \neg D4$
Global	4550	670	80	114	21
$\hookrightarrow$ Lagniez [?]	1948	213	40	52	11

$\hookrightarrow$ Sundermann [?]	2	0.500	1.000	0.500	1.000

Table 5: Experimental results for CapKC. Column $\#F$ indicates with how many formulae the statistics have been computed. The 'Coverage' column indicates how often $|R_F|$ is within the confidence interval $[Y_l; Y_h]$ and thus measures the accuracy of our method.

Dataset	#F	$Y_l \geq R_{G_P} $	$Y_h \leq R_{G_U} $	Both	$median(r_c)$	$max(r_c)$
Global	3669	0.807	0.836	0.721	4.17e-9	0.54
$\hookrightarrow$ Lagniez [?]	1689	0.844	0.869	0.760	1.8e-9	0.54
$\hookrightarrow$ Soos [?]	1307	0.920	0.893	0.834	1.75e-7	0.0962
$\hookrightarrow$ Plazar [?]	403	0.697	0.769	0.610	1.64e-13	0.0153
$\hookrightarrow$ Sundermann [?]	270	0.196	0.448	0.093	1.69e-13	0.281

Table 6: Experimental results comparing the bounds obtained with DivKC-AMC and with Lemma ???. Column #F indicates with how many formulae the statistics have been computed. The 'Both' column indicates how often we have $Y_l \geq |R_{G_P}| \wedge Y_l \leq |R_F|$ and $Y_h \leq |R_{G_U}| \wedge Y_h \geq |R_F|$. The last two columns represent the observed median and maximum values of the ratio $r_c = \frac{\min(Y_h, |R_{G_U}|) - \max(Y_l, |R_{G_P}|)}{|R_{G_U}| - |R_{G_P}|}$, which was calculated exclusively if $Y_l \leq |R_F| \leq Y_h$. The number of formulae on which the last two columns are computed can easily be obtained by multiplying the #F column with the 'Coverage' column in Table 4.

Dataset	#F	$Y_h \leq R_{G_U} $	$median(r_c)$	$max(r_c)$
Global	334	0.994	0.00794	0.0257
$\hookrightarrow$ Lagniez [?]	175	0.994	0.0072	0.0257
$\hookrightarrow$ Soos [?]	153	0.993	0.00837	0.0257
$\hookrightarrow$ Plazar [?]	4	1.000	0.00684	0.0257
$\hookrightarrow$ Sundermann [?]	2	1.000	0.00981	0.0155

Table 7: Experimental results comparing the bounds obtained with CapKC. Column #F indicates with how many formulae the statistics have been computed. The last two columns represent the observed median and maximum values of the relative confidence-interval width $r_c = \frac{Y_h - Y_l}{|R_{G_U}|}$.

Dataset	#F	$l \leq Y_{ApproxMC} \leq h$	$l \leq Y_{DivKC-AMC} \leq h$	$l \leq Y_{CapKC-AMC} \leq h$
Global	2713	0.973	0.871	0.981
$\hookrightarrow$ Lagniez [?]	1329	1.000	0.889	0.980
$\hookrightarrow$ Soos [?]	1177	0.964	0.847	0.979
$\hookrightarrow$ Plazar [?]	185	0.838	0.892	0.995
$\hookrightarrow$ Sundermann [?]	22	1.000	0.955	1.000

Table 8: Experimental results comparing the accuracy of DivKC-AMC and CapKC-AMC with ApproxMC 7. Column #F indicates with how many formulae the statistics have been computed. Column $l \leq Y_A \leq h$ indicates how often the model count returned by A is within the indicated bounds, with $l = \frac{|R_F|}{1.2}$ and $h = 1.2 \times |R_F|$.

Dataset	#F	$l \leq Y_{ApproxMC} \leq h$	$l \leq Y_{DivKC-AMC} \leq h$	$l \leq Y_{CapKC-AMC} \leq h$
Global	298	0.997	0.500	0.826
$\hookrightarrow$ Lagniez [?]	148	1.000	0.486	0.824
$\hookrightarrow$ Soos [?]	147	0.993	0.503	0.830
$\hookrightarrow$ Plazar [?]	3	1.000	1.000	0.667
$\hookrightarrow$ Sundermann [?]	0			

Table 9: Experimental results comparing the accuracy of DivKC-AMC and CapKC-AMC with ApproxMC 7. Column #F indicates with how many formulae the statistics have been computed. Column $l \leq Y_A \leq h$ indicates how often the model count returned by A is within the indicated bounds, with $l = \frac{|R_F|}{1.2}$ and $h = 1.2 \times |R_F|$. We only consider formulae for which $|R_{G_U}| \neq |R_F|$, thereby excluding cases where $CapKC$ returns $G_U = F$ and the model count can be obtained directly from G_U .
